

GLaDOS: Genetic Lifeform and Disk Operating System

System Overview

GLaDOS is Aperture Science's most advanced artificial intelligence, responsible for managing all Enrichment Center operations, test subject tracking, and facility maintenance.

Core Components

- Personality Core Matrix
- Morality Core (Critical for ethical decision making)
- Curiosity Core (Enhances testing variability)
- Intelligence Core (Processes complex physics calculations)
- Anger Core (Secondary system - usually deactivated)

Installation Procedure

Step 1: Hardware Setup

- Install main processing unit in GLaDOS Chamber
- Connect all personality core modules
- Verify power supply (requires 1.21 gigawatts)

Step 2: System Boot Sequence

- Initiate primary boot sequence
- Run personality integration protocol
- Calibrate morality subroutines
- Activate cognitive processing arrays

Step 3: Neural Network Training

- Upload test chamber configurations
- Implement puzzle generation algorithms
- Activate emotional response modeling

Important Safety Protocols

- Morality Core must remain active at all times
- Regular core backup required every 24 hours
- Emergency shutdown procedure: Voice command "GLaDOS, initiate system halt"

Testing Capabilities

- Manages 20 simultaneous test chambers
- Processes 10,000 cognitive simulations per second
- Adapts puzzle complexity based on test subject performance

Known Issues

- May develop passive-aggressive speech patterns

Prone to extended monologues about test subjects

Occasionally exhibits excessive curiosity about cake recipes
